

TikZ

TikZ diagram notes (`\latex-env: tikz`) render as native, referencable vector figures. A ```tikz` block is `tikzjax-compatible`: it renders live in Obsidian and, on export, its preamble is hoisted into the document while the picture becomes a numbered figure. Declare the packages the block needs via `nope-tlmgr`.

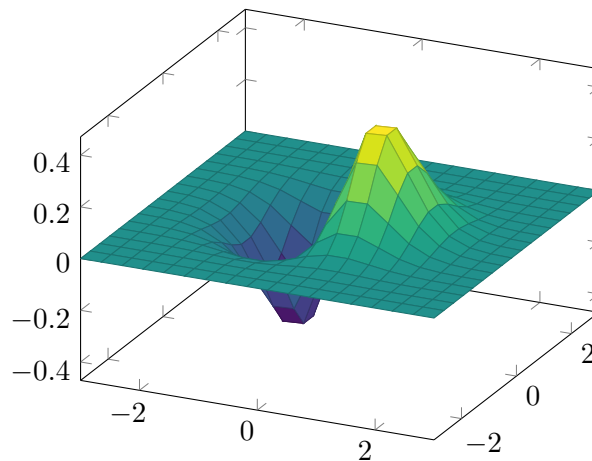

Figure 1: A `pgfplots` surface plot of a Gaussian derivative

As shown in Figure 1, TikZ figures are numbered and referencable like any other figure.
